E. ACCESS TO MICRODATA

Microdata, or unit record data, is the form from which all data outputs are derived and is the primary form that data is stored in. A microdata file is a data file created by coding and electronically recording each survey respondent's responses to all relevant questions.

This file includes the data provider's responses to the questionnaire. For this reason, a microdata file is anonymised using specific statistical software to prevent the identification of sensitive data provided by respondents. Microdata may be accessed under contract through the following:

- *Encrypted CDs*: CDs containing information which is converted into unreadable code so that it cannot be deciphered easily by unauthorized people
- *Safe centre*: This defines access to protected microdata from a specific safe place (e.g. the NSO) where a properly identified person can directly work with the confidential data. During the whole process the data stays at the safe centre and tabular data is only provided to the user once it is properly evaluated by NSO staff. The physical security of the data and the risk of data leaking are ensured by strong IT requirements all along the process.
- *Remote access facility*: This defines online access to protected microdata and is therefore similar to access through a safe Centre with the only difference that the point of access could be somewhere outside NSO.

18. Would you be interested in accessing anonymised microdata for research studies? *(Tick one option only)*

- Yes ₁ → **Go to Question 20**
 No ₂ → **Go to Question 19**

19. Why would you not be interested to make use of anonymised microdata? *(Tick one option only)*

- Lack of expertise to carry out the analysis ₁
 It is easier to request the information directly to NSO ₂
